Warm Downstream K1 Computational Latency

Phase N benchmark after feature/probability availability. This is post-window incident classification, not end-to-end live BGP detection latency.

Complete downstream path: mean 25.579448 ms/incident, median 24.774990, p95 27.634936, p99 27.889154; throughput derivative 39.09 incidents/s.

Excluded: live collection, MRT parsing, window accumulation, Behavioral, CAIDA, RPKI/ROV enrichment, startup/loading, and complete live pipeline overhead.
